

## **AMENDMENTS TO SPECIFICATION**

Please amend paragraph [0003] as follows:

[0003] Other forms of slowly digestible starches include resistant starches (e.g., ~~HighCorn~~ resistant starches sold under one or more of the trademarks HIGHMAIZE, NOVELOSE, ACTISTAR, and CRYSTALEAN ~~Novelose, ActiStar, CrystaLean~~). These starches exhibit a high crystalline percentage, and about 50% digestible in the small intestine. The remainder is fermented in the large intestine. The percentage digestible in the small intestine is largely digested ~~vary~~ very fast, so that resistant starches only makes sense on a limited bases as a food additive for reducing the GI.
